Supplementary Methods

Fluorescent in-situ hybridization (FISH)

BAC clones containing the MYB gene (RP11-104D9) and the NFIB gene (RP11-54D21 and RP11-79B9) were labeled with spectrum green and spectrum red, respectively (Abbott Laboratories). Hybridization and detection were done according to the manufacturer's protocols. To determine the gene fusion status, 200 individual nuclei were analyzed for each case. The interphase nuclei were captured and processed using the Quantitative Image Processing System (Applied Imaging).
